

YOUR MAGIC NUMBER

\$832,607

Accumulating this capital by age 65, you secure \$4,000 per month for 20 years of retirement.

Conservative scenario (investing the capital at 1.0% real during retirement): \$873,218

Your data

Current age	48
Retirement age	65
Planned years in retirement	20
Required monthly income	\$4,000/mo
Current savings	\$50,000
Monthly savings	\$500/mo
Investment profile	Treasuries (1.5% real)

Your projection at retirement

PROJECTED SAVINGS

\$180K

at age 65

22% of your Magic Number (\$833K)

YEARS OF COVERAGE

3

until age 68

SHORTFALL

Assumes investing from today until retirement at 1.5% real (Treasuries), with monthly compounding, in constant (today) dollars.

Your year-by-year trajectory

Year	Age	Projected balance	Phase
0	48	\$50,000	Accumulation
5	53	\$84,865	Accumulation
10	58	\$122,357	Accumulation
15	63	\$162,673	Accumulation
17	65	\$179,638	You retire
20	68	\$40,545	Drawdown
25	73	\$0	Drawdown
30	78	\$0	Drawdown
35	83	\$0	Drawdown
37	85	\$0	Drawdown

How much to save per month, by investment profile

To reach your Magic Number on time, on top of the \$500/mo you already save:

Profile	Real return	Additional savings
Vault	-2.4%	\$4,296/mo
CDs	0.5%	\$3,160/mo
Treasuries	1.5%	\$2,824/mo
60 / 40	4.1%	\$2,012/mo
80 / 20	5.0%	\$1,771/mo
100% Equities	5.9%	\$1,544/mo

The cost of waiting

If you wait instead of starting today, this is what you give up (Treasuries, 17-year horizon):

Starting today		\$179,638
Waiting 1 year	\$171,094	-\$9K
Waiting 3 years	\$154,374	-\$25K
Waiting 5 years	\$138,133	-\$42K
Waiting 10 years	\$99,536	-\$80K

How we calculate — Methodology

Your Magic Number

It is the present value of a monthly annuity: the capital that, invested through retirement, lets you withdraw your required monthly income (net of pension income) for the years you planned, plus any legacy capital. Computed with monthly compounding.

Real returns, not nominal

All calculations use REAL returns (net of inflation) and are expressed in constant (today) dollars, so every amount keeps its purchasing power — no inflated feel-good numbers.

Investment profiles

Each profile uses a long-term historical nominal return. The real return is derived by adjusting for expected inflation (Fisher equation). Past performance does not guarantee future results. If you set an annual asset tax, we also subtract it (tax drag) in calculations.

Profile	Nominal return	Real return (inflation 2.5%)
Vault	0.0%	-2.4%
CDs	3.0%	0.5%
Treasuries	4.0%	1.5%
60 / 40	6.7%	4.1%
80 / 20	7.6%	5.0%
100% Equities	8.5%	5.9%

Projections and coverage

Projected savings compound your current savings plus monthly contributions month by month (including the savings boost when debts are paid off). Years of coverage simulate retirement: each year the capital earns returns and your spending is withdrawn; we count full years it lasts.

Model limitations

The model does not account for local taxes, sequence-of-returns risk (year-to-year volatility), or changes in your income or expenses. Historical returns do not guarantee future returns. This is an educational planning tool, not a promise.

Important notice

This report is educational and does not constitute financial, legal or tax advice. Projections are estimates based on the described assumptions and the data you entered. Consult a licensed financial advisor before making investment decisions.
